## Keyboard Shortcuts (part 1 of 2)

**What:** Allows you to navigate excel and perform tasks much quicker than when a mouse is used.

**Why:** Learning the Keyboard shortcuts will drastically improve your efficiency when working in Excel.

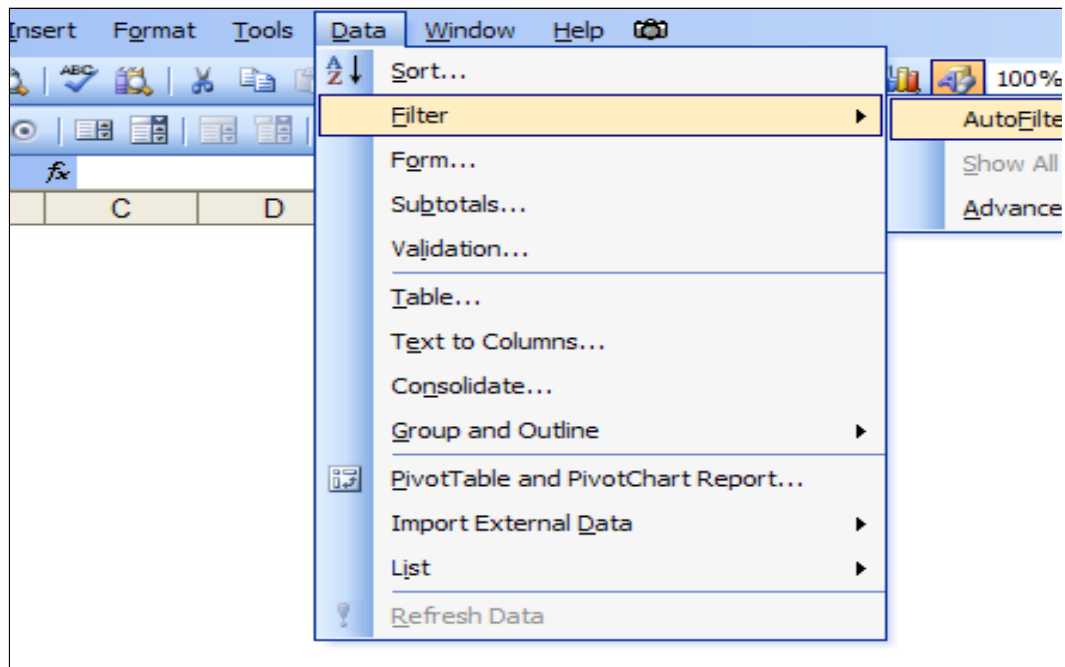

Note: Not all keyboard shortcuts will work in precisely the same way on Excel for Mac. In general, the shortcuts are the same, but the key combinations may differ.

### Menu-based Keyboard shortcuts

Applicable to all Microsoft Office applications.

Looking at the toolbar above, we can see that one letter for each menu item is underlined. When you press that letter, the corresponding dropdown will open. From here press the letter for the item you want.

For example, to open up a simple data filter, one would normally have to click on the Filter button in the Data menu. Using a keyboard shortcut, one would press ALT + D + F + F (that is, the alt button, then D, then F, then F).

se has to be involved.  
orking in excel

eneral, the "Apple key" replaces the "Control" key for most commands.

underlined. If you press and hold the "alt" button and then press one of these underlined le  
you want to access.

in Data -> Filter -> AutoFilter in the Toolbar  
ton, then the "D", then "F", then "F")

atters,

## Keyboard Shortcuts (part 2 of 2)

**What:** A list of useful keyboard shortcuts that are not menu-based

**Why:** Learning the Keyboard shortcuts will drastically improve your efficiency

Note: Not all keyboard shortcuts will work in precisely the same way on Excel

### General

New file	Ctrl + N
Open file	Ctrl + O
Save file	Ctrl + S
Move between open workbooks	Ctrl + F6
Close file	Ctrl + F4
Save as	F12
Display the print menu	Ctrl + P
Select whole spreadsheet	Ctrl + A
Select column	Ctrl + Space
Select row	Shift + Space
Undo last action	Ctrl + Z
Redo last action	Ctrl + Y
Exit Excel	Alt + F4
Spell Check	F7
Cut	Ctrl + X
Copy	Ctrl + C
Paste	Ctrl + V
Find text	Ctrl + F
Recalculate	F9

### Navigating

Move to next cell in row	Tab
Move to previous cell in row	Shift + Tab
Up one screen	Page Up
Down one screen	Page Down
Move to next worksheet	Ctrl + Page Down
Move to previous worksheet	Ctrl + Page Up
Go to first cell in data region	Ctrl + Home
Go to last cell in data region	Ctrl + End
Data Region Left	Ctrl + Left Arrow
Data Region Right	Ctrl + Right Arrow
Data Region Down	Ctrl + Down Arrow
Data Region Up	Ctrl + Up Arrow

Select Whole Data Region	Ctrl + Shift + 8
Move to Next Sheet	Ctrl + Page Down
Move to Prior Sheet	Ctrl + Page Up
Access Drop down menu	Alt + Down/Up
Zoom in / out	Ctrl + mouse scroll

ciency when working in excel

el for Mac. In general, the "Apple key" replaces the "Control" key for most commands.

### Formatting Text In Worksheet

Bold toggle for selection	Ctrl + B
Italic toggle for selection	Ctrl + I
Underline toggle for selection	Ctrl + U
Strikethrough for selection	Ctrl + 5
Change the font	Ctrl + Shift + F
Change the font size	Ctrl + Shift + P
Apply outline borders	Ctrl + Shift + 7
Remove all borders	Ctrl + Shift + Underline
Wrap text in same cell	Alt + Enter

### Formatting Cells

Format cells	Ctrl + 1
Select font	Ctrl + Shift + F
Select font size	Ctrl + Shift + P
Format as number	Ctrl + Shift + 1
Format as date	Ctrl + Shift + 3
Format as currency	Ctrl + Shift + 4
Format as percentage	Ctrl + Shift + 5

### Editing/Deleting Text

Delete one character to right	Delete
Delete one character to left	Backspace
Edit active cell	F2
Cancel cell entry	Escape Key

### Highlighting Cells

Select entire worksheet	Ctrl + A
Select entire row	Shift + Spacebar
Select entire column	Ctrl + Spacebar
Manual select	Shift + Arrow Key

### Inserting Text Automatically

Autosum a range of cells	Alt + Equals Sign
--------------------------	-------------------

Insert the date

Insert the time

Insert columns/rows

Insert a new worksheet

Ctrl + ; (semi-colon)

Ctrl + Shift + ; (semi-colon)

Ctrl + Shift + + (plus sign)

Shift + F11

## Keyboard Shortcuts, Excel for Mac

# Keyboarding examples

What: Inserting rows and columns

## Excel for Windows users

### Inserting rows: Alt-I-R

*Insert, Row*

### Inserting columns: Alt-I-C

*Insert, Column*

## Excel for Mac users

### Inserting rows: SHIF

*Select full row, then delete s*

### Inserting columns: C

*Select full row, then delete s*

## exercise 1: Insert a column after every blue column and a row

## Absolute vs. Relative references

To create an absolute reference, you insert a dollar sign (\$) before the column & For example, the cell reference \$B\$8 is an absolute reference, whereas the cell If you copy a formula that contains the absolute reference \$B\$8 to another cell, On the other hand, if you copy a formula containing the relative reference B8 to

Relative	formula	result	
1	=C10	1	Both the ro In this case
2		2	
3		3	
4		4	
5		5	
Absolute	formula	result	
1	=\$C\$10	0	When copy
2		0	
3		0	
4		0	
5		0	

To create a reference to another sheet, include the sheet name, followed by an

and row of the cell reference.  
reference B8 is a relative reference.  
the cell reference \$B\$8 does not change.  
another cell, the reference B8 changes.

w and columns change based on their relative positions  
, as the row changes, so does the row's relative reference

ed down, the reference stays the same

exclamation mark (!), then the cell range

## Find and Replace

**What:** How to use the Find and Replace function

**Why:** Can use this to quickly manipulate data

### start by going to either:

Edit -> Find

Edit -> Replace

Tips:

If a highlighted region is selected, Excel will only search within that region.

---

## Wildcard characters

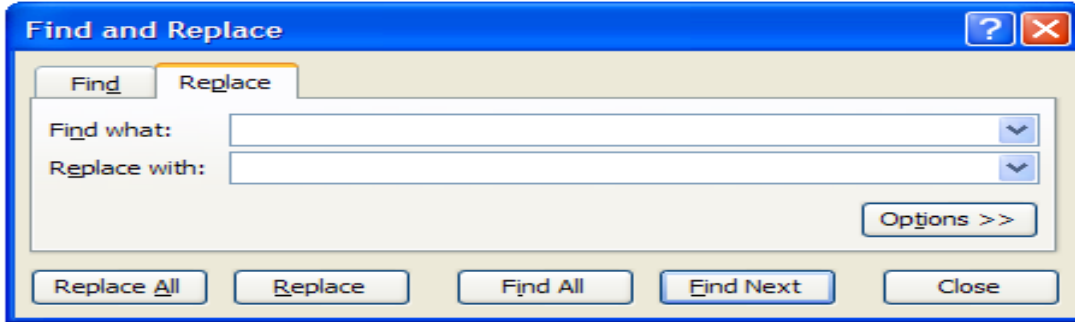

Use
? (question mark)
* (asterisk)
~ (tilde) followed by ?, *, or ~

### important:

Wildcards work the same way for data as they do for text.

ctionality  
ata

cel will only search that region, otherwise, Excel will search the entire sheet by default

---

## rs

### To find

Any single character

For example, sm?th finds "smith" and "smyth"

Any number of characters

For example, \*east finds "Northeast" and "Southeast"

A question mark, asterisk, or tilde

For example, fy91~? finds "fy91?"

a filters

---

## Dates and Time formats in Excel

**What:** Excel has specific methods for storing Dates and times

**Why:** Understanding how to manipulate date formats is a common necessity when creating reports

**Source:** <http://www.excelwiki.com/Excel/DateAndTimeBasics>

### How Excel stores dates and times.

The basic unit of time in Excel is a day.

A day equals 1, half a day is .5 and an hour time interval is therefore  $1/24=0.04166666$

Dates are stored as serial values with time starting on January 1, 1900.

January 1,1900 equals 1 and December 1, 2005 equals 38,687 as it 38,687 days after January 1, 1900.

One hour past midnight is serial value 38687.041666667 and Noon on December 1, 2005 is 38687.5

Storing dates as sequential numbers makes it easy to add, subtract and determine time intervals.

Dates entered without a specified year are assumed to be in the current year. A date entered without a month or day is assumed to be the first day of the month.

Dates entered with a 2 digit year are stored as pre-2000 dates if the year is between 30 and 99. For example, 28/02/05 is in year 2005, 28/02/98 is in 1998, 28/02/29 is in 2029 and 28/02/30 is in 1930.

---

### The 1904 Date System

Macintosh computers typically use the 1904 date system with January 2, 1904 equal to serial value 1.

This can cause date discrepancies if files are transferred from Mac to Windows or vice versa.

Date values will change by 4 years and 1 day.

Excel users in Windows may also inadvertently be using the 1904 date system and

this will also cause dates to change if the file is sent to a user on the more common 1900 date system.

Click on **Tools-Options-Calculation** and ensure that the 1904 date system checkbox is unchecked.

---

### How Excel displays dates and times.

Dates are stored in Excel cells as serial values but can be displayed in various date formats.

Each of the dates at the right has an underlying serial value of 38598.

Note that the time value is midnight (at the start of the day).

The examples on the right use the US date format mm/dd/yyyy

The date format can be changed to the UK date format (dd/mm/yyyy) by changing the cell format.

Excel will recognize an input that is in a date format.

If a user inputs **Dec 1, 2005** or **10 May 2004** Excel will recognize this as a date,

store it in the cell as a serial value, and display it in a date format.

Excel sometimes makes *mistakes*. A user may enter 3-4, meaning a value between 3 and 4, but Excel will interpret this as March 4th and store the input as 38415. This can be removed by using the following formula:

ports in excel

7

January 1, 1900.

2005 is 38687.5.

30 intervals between two dates or times.

Entered as Feb-28 (in 2005) is stored as 28/2/2005 or date serial 38411.

0) and 99 or as post-2000 dates if the year is between 0 and 29.

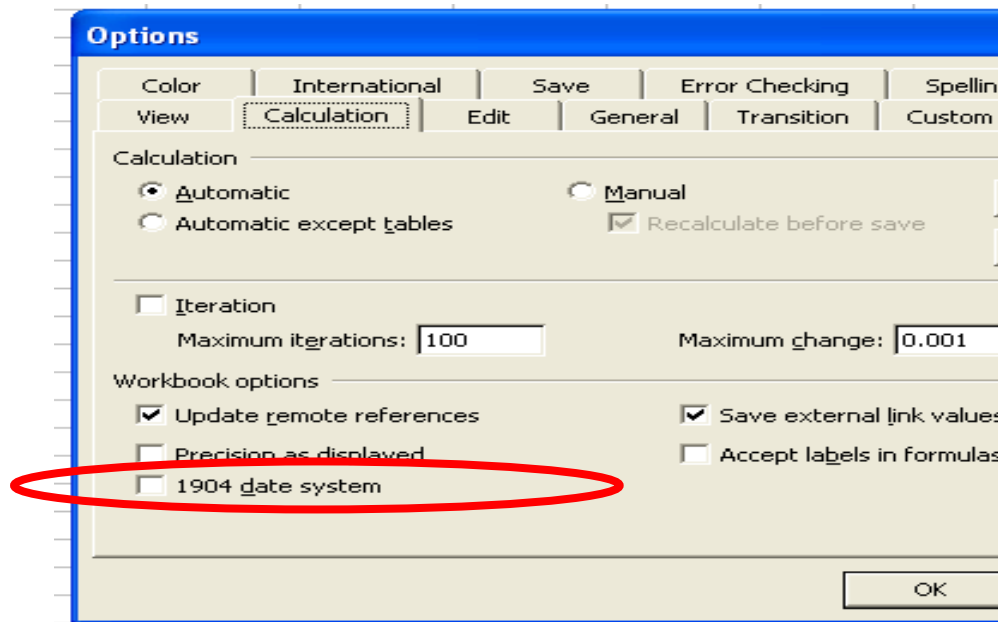

30.

1.

versa.

## Function basics

**What:** Excel Function basics and syntax

**Why:** Understand what all those different brackets and punctuation means

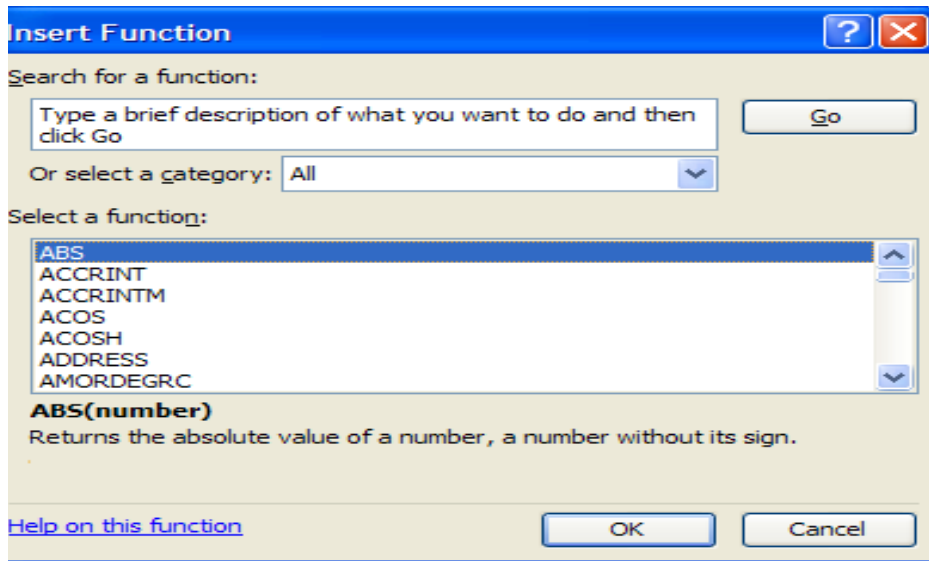

Functions always begin with a "="  
Arguments separated by a comma  
Optional arguments are enclosed in [] brackets  
Type "=Function Name(" to get the signature

To find a list of all excel functions, go to **Insert-->Function** 

Character Used to:

\$	Turns a relative reference to an absolute reference
'	If a sheet name has a space between it, Excel will automatically put
!	Placed after a string to signify a reference to a sheet with that name
{ }	Enclose "array" formulas. These braces are added when you hit ctrl+

a ' ' around the sheet name when it is referenced from another sheet

;

Ctrl+Shift+Enter; you must do this every time you enter or change an array formula

# Error Checking

Errors happen, but if you know why they are happening, they can help you to understand your data. There are 7 different types of errors in Excel:

- #NULL! Occurs when you specify an intersection of two areas that do not intersect. The intersection does not exist.
- #NUM! Occurs when a number is divided by zero (0).
- #VALUE! Occurs when the wrong type of argument is used.
- #REF! Occurs when a cell reference is not valid.
- #NAME? Occurs when Microsoft Excel doesn't recognize text in a formula.
- #NUM! Occurs with invalid numeric values in a formula or function.
- #N/A Occurs when a value is not available to a function or formula.

to find if a value in a cell is an error, use the ISERROR() function  
to create a #N/A, use the NA() function

---

## Example

Standard problem:

	1	25
	2	30
	3	#N/A
	4	15
<b>total</b>		<b>#N/A</b>

	1	25
	2	30
	3	#N/A
	4	15
<b>total</b>		<b>#N/A</b>

  
**The error messes up computations**

ta

Intersection operator is a space between references.

---

error check	25
	30
	15
	<b>70</b>

formula used:  
`=IF(ISERROR(G18),"",G18)`

**Can now find the total despite the bad data**

---

## Text Manipulation

**What?** Formulas used to work with text strings, including RIGHT(), LEFT

**Why?** These functions allow you to parse and combine text strings. Fre

### =RIGHT(text, [num-characters])

*Takes num-characters from the right side of text*

<u>Text</u>	<u>Formula</u>
Bill Clinton	=RIGHT(B9,4)
Bill Clinton	=RIGHT(B10,1)

### =LEFT(text, [num-characters])

*Takes num-characters from the left side of text*

<u>Text</u>	<u>Formula</u>
Bill Clinton	=LEFT(B16,4)
Bill Clinton	=LEFT(B17,1)

### =MID(text, start-position, num-characters)

*Takes num-characters from text starting at start-positio*

*Use a large number (like 999) for num-characters if you characters in a string*

<u>Text</u>	<u>Formula</u>
Bill Clinton	=MID(B24,4,4)
Bill Clinton	=MID(B25,FIND(" ",B25),999)

### =text1&text2

*Glues text1 and text2 together*

<u>Text</u>	<u>Formula</u>
Bill Clinton	=B31&" was a US president"

### =FIND(text-to-find, within-text, [start-position])

*Finds text-to-find within within-text and returns the cha*

*For basic cases, you don't need start-position*

<u>Text</u>	<u>Formula</u>
Bill Clinton	=FIND("l",B38)
Bill Clinton	=FIND("n",B39,10)
Bill Clinton	=FIND("X",B40)

()), MID(), and "&" to glue together text strings  
requently useful when working with pulled from other data sources

# xt functions

Description
Changes full-width (double-byte) English letters or katakana within a character string to half-
Converts a number to text, using the ฿ (baht) currency format
Returns the character specified by the code number
Removes all nonprintable characters from text
Returns a numeric code for the first character in a text string
Joins several text items into one text item
Converts a number to text, using the \$ (dollar) currency format
Checks to see if two text values are identical
Finds one text value within another (case-sensitive)
Formats a number as text with a fixed number of decimals
Changes half-width (single-byte) English letters or katakana within a character string to full-
Returns the leftmost characters from a text value
Returns the number of characters in a text string
Converts text to lowercase
Returns a specific number of characters from a text string starting at the position you specify
Extracts the phonetic (furigana) characters from a text string
Capitalizes the first letter in each word of a text value
Replaces characters within text
Repeats text a given number of times
Returns the rightmost characters from a text value
Finds one text value within another (not case-sensitive)
Substitutes new text for old text in a text string
Converts its arguments to text
Formats a number and converts it to text
Removes spaces from text, except for single spaces between words
Converts text to uppercase
Converts a text argument to a number

Adds strings of text together

Anything following the ' sign is converted to a string. Useful if trying to write the equals sign

Use double quotes (" ") to signify a string. Example: 45 is a number, but "45" is a string of chara

acters

## Text Manipulation

**exercise 1:** Capture the year from the election column

**exercise 2:** Use a text formula to get rid of the \* in front of the president's

**exercise 3:** Create a sentence that looks like this "Bill Clinton won the 1996 election"  
**(Answers below the fold)**

President	Vote %	Election	Exercise 1
* James K. Polk	49.3%	1844 election	
* Zachary Taylor	47.3%	1848 election	
* James Buchanan	45.3%	1856 election	
* Abraham Lincoln	39.9%	1860 election	
* James Garfield	48.3%	1880 election	
* Grover Cleveland	48.8%	1884 election	
* Grover Cleveland	46.0%	1892 election	
* Woodrow Wilson	41.8%	1912 election	
* Woodrow Wilson	49.3%	1916 election	
* Harry S. Truman	49.7%	1948 election	
* John F. Kennedy	49.7%	1960 election	
* Richard Nixon	43.2%	1968 election	
* Bill Clinton	42.9%	1992 election	
* Bill Clinton	49.2%	1996 election

## Data Filters

### Alt + D + F + F (Data - Filter - AutoFilter)

(Windows-based Excel only)

Keyboard shortcut: Hold down the Alt key (*use Option key for Excel for Mac*) to activate the data filter to show a list of all unique entries in that column

Filtered columns have a blue arrow

Filtered rows have blue numbers

All rows not matching the selected criteria are hidden

	column1	column2
86		4
76		7
9		3
23		2
-	abc	
52		6

# Conditional Formatting

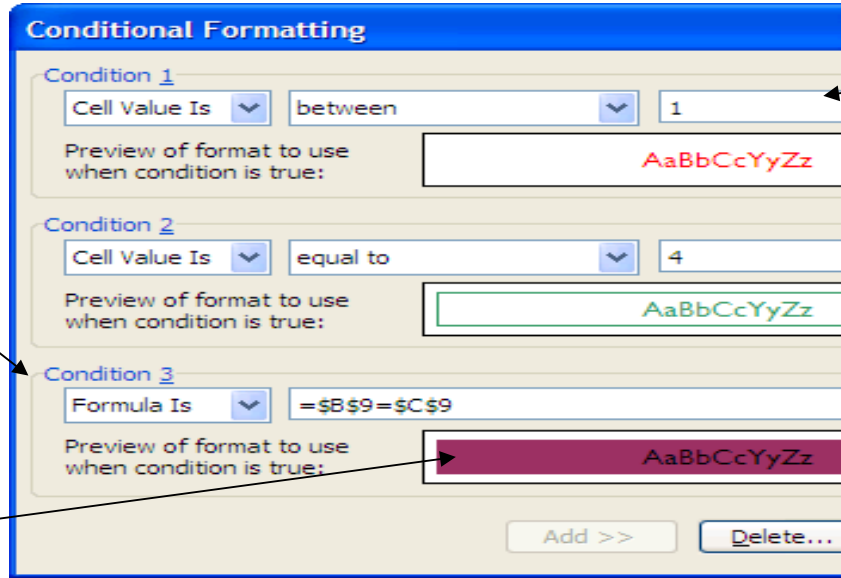

**What?** Conditional formatting allows you to define the format of individual cells based on a

**Why?** This feature can be used to make your reports look better or to highlight specific val

**How?** Select "Format -- Conditional Formatting" from the menu to find this dialog box:

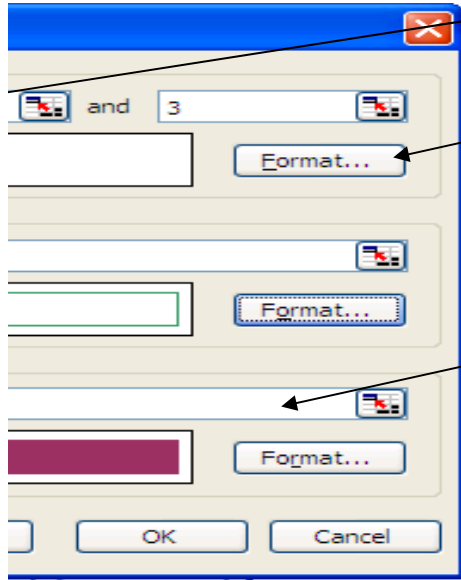

Only up to 3 conditions can be defined. The first condition takes precedence over the second, etc.

This box previews the format of the cell when the condition is met

a series of criteria  
ues in a table

**Tip:** Use the "Format Painter" function to copy  
conditional formatting across cells 

Condition 1 is met if  
the value of the cell is  
between 1 and 3.

Click here to select  
the format of the  
font, border, and  
patterns

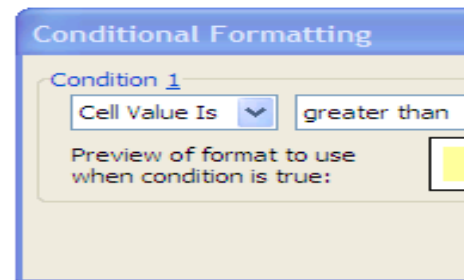

Formulas allow you to use  
absolute or relative  
references to determine  
whether the condition is met

Use "Add" to create new  
conditions

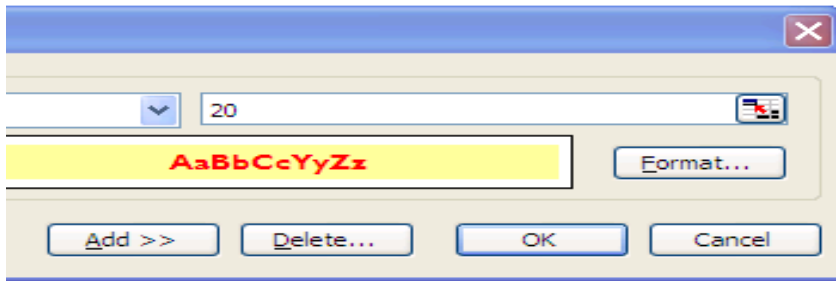

# Conditional Formatting, Example 1

Name	HR
Adam Dunn	30
Adam LaRoche	17
Adrián González	18
Albert Pujols	32
Brad Wilkerson	15
Carlos Delgado	24

## Conditional Formatting Exercises

1. Make the numbers in this table red if  $<0$ , green if  $>0$

A	-12
B	8
C	23
D	-3

2. Make every third row in this list grey

(Hint: The function "Row()" returns a row number)

A	9.0
B	9.4
C	2.5
D	5.5
E	2.3
F	7.5
G	1.7
H	3.1

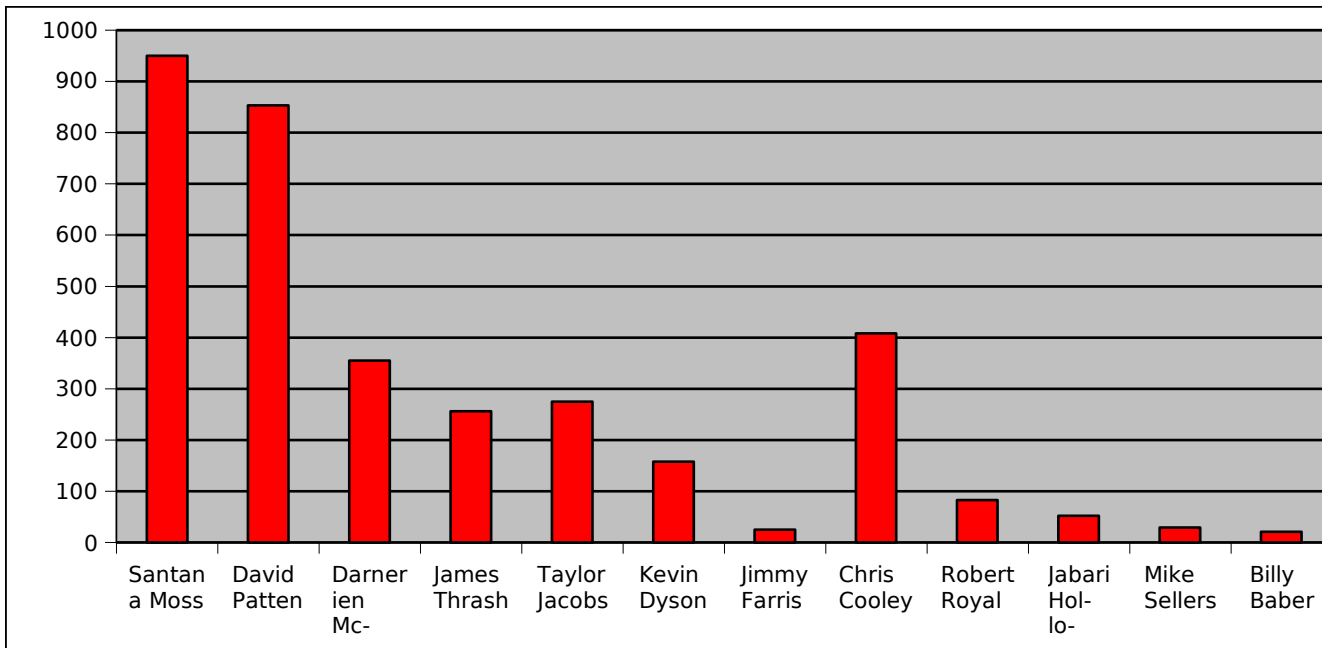

3. Bold the words in this list that are longer than 8 letters long

(Hint: The function "Len(text)" returns the number of characters in a string)

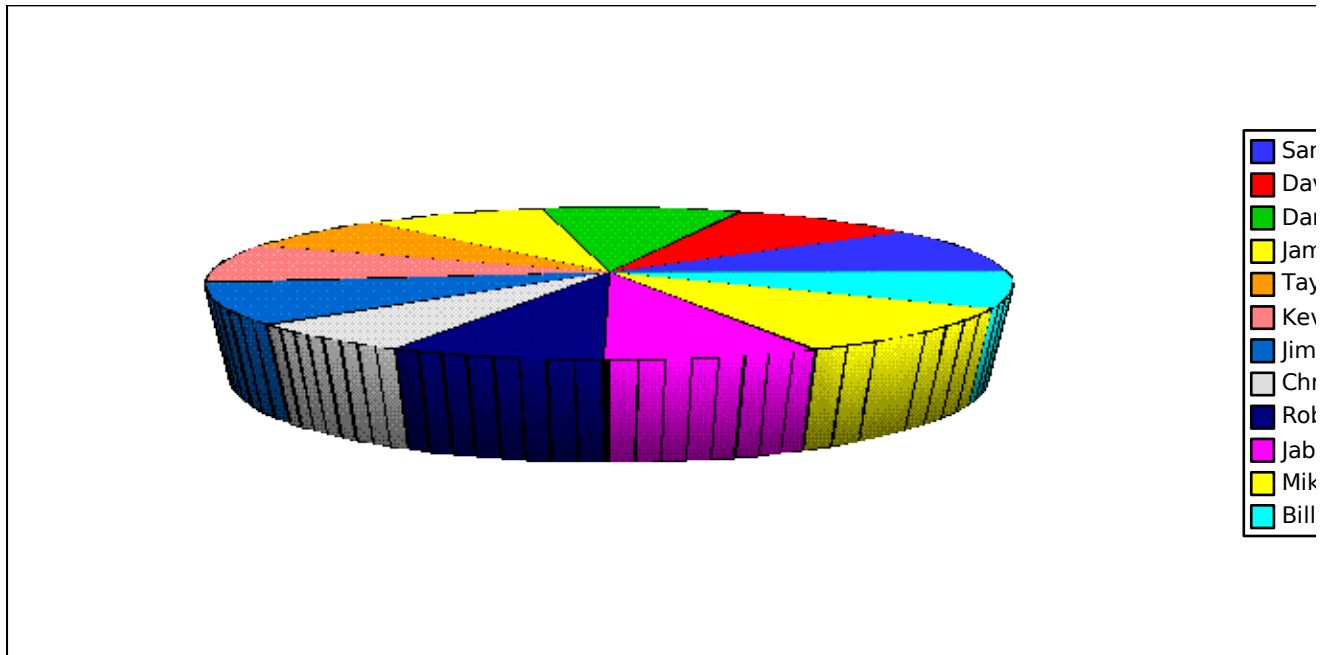

Honey  
Grapefruit  
Milk  
Tea  
Cinnamon

# Exercise 1: Change the formatting in Graph A to look the same

**Graph A**

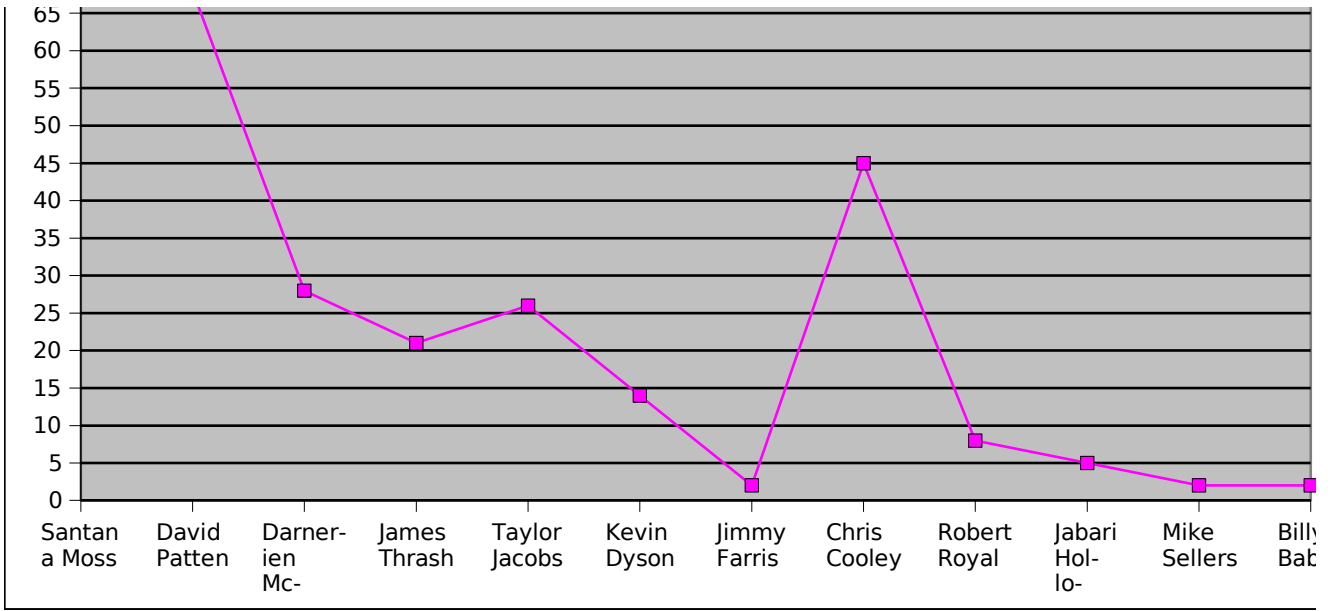

**Graph A**

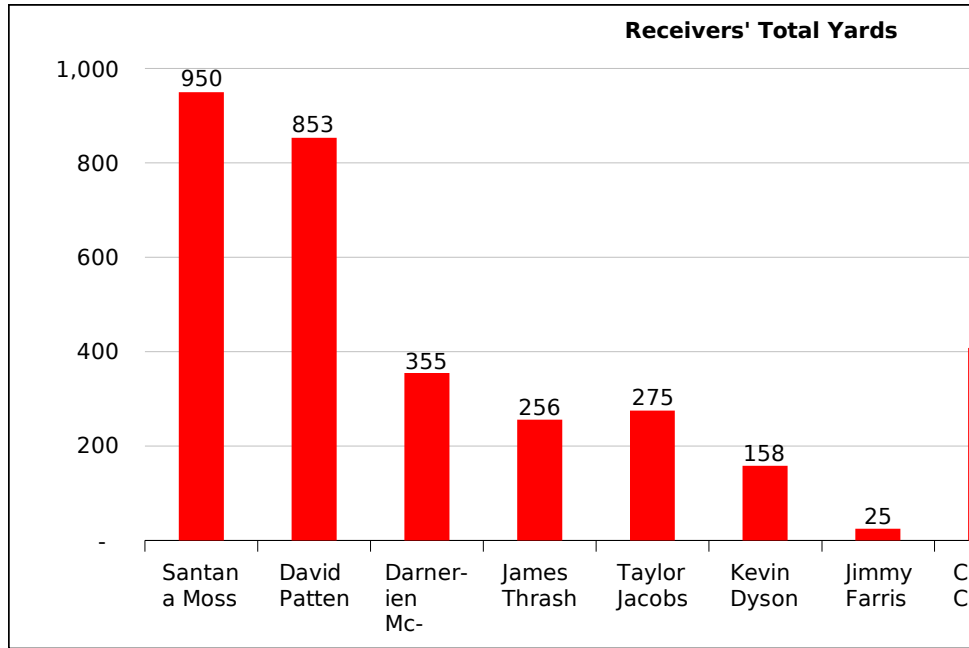

**Graph A**

as Graph B (three examples)

## Charts: exercise

Microsoft Excel has notoriously bad defaults for its charts.

Exercise: Change the formatting of the chart on the right to reduce the chart junk. Answers

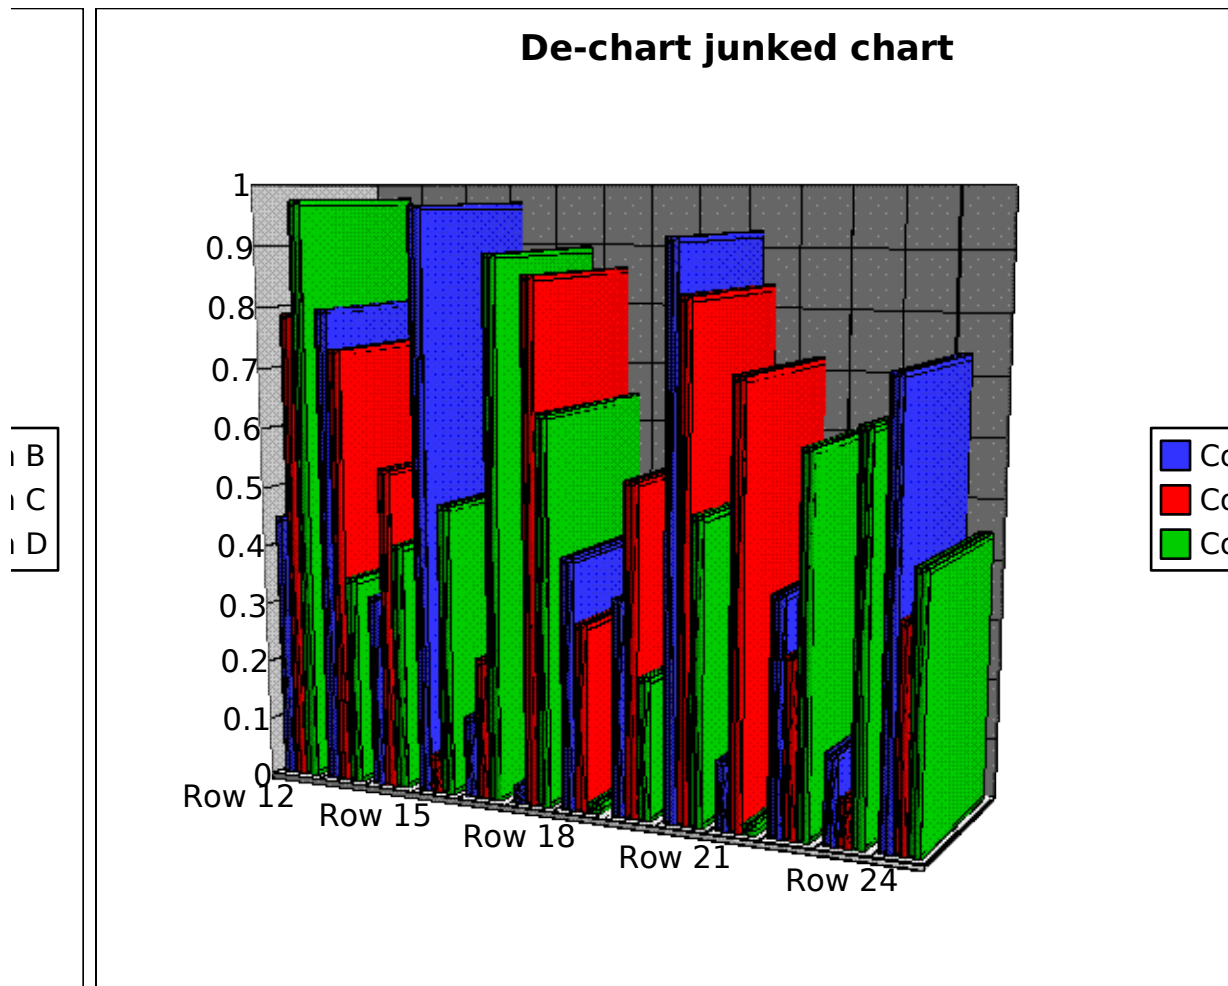

[Visit this site for more examples of fixing charts: http://www.perceptualedg](http://www.perceptualedg)

Ideas for cleaning this chart:

- \* Eliminate 3-D (Chart -- Chart Type -- Select 2-D column chart)
- \* Eliminate the table at the bottom of the chart (Right click on table -- Clear)
- \* Eliminate gray background and border (Double click on chart background, select None un
- \* Eliminate vertical gridlines. (Right click on a vertical gridline and select Clear)
- \* Optional: Eliminate borders around the columns. (Double click on column and select None

below.

[e.com/examples.htm#](http://e.com/examples.htm#)

(der Area and None under Border)

(e under Border)

Column B  
Column C  
Column D

### Exercise 3: Secondary Axis

It is often useful to show two related data series in a single chart. If the series have very different scales you will want to add a second axis. Here's how you do it:

1. On Chart Menu, select Source Data
2. Change the data range to include the second metric
3. You will see that the second series doesn't fit well given the scale on the y-axis
4. Right click on the second series and choose Format Data Series
5. Under the Axis tab, select Secondary axis. The new axis will be auto-scaled for the series

year	amount	second metric
1997	23564	25
1998	27948	25
1999	31500	50
2000	33021	50
2001	35093	70
2002	36927	80
2003	37321	75
2004	41002	65
2005	43982	60
2006	47283	55

very different scales

second data series

## Exercise 4: Mixed Chart Types

You have more flexibility with Excel charts than you may know. Excel gives you the ability to create custom chart types under the customer chart types in the Chart Type dialog box.

Fortunately, you don't need to depend entirely on these pre-defined custom types.

Making Mixed Charts is as easy as selecting one of the data ranges in your chart, right clicking, and selecting Chart Type

**The Chart Type that you select will only apply to the range you selected**

Practice with the chart below to discover the different combinations that are possible

ability to mix certain chart types. You may have seen some of these
